Accelerated Gradient Methods

Lecturer: Jiaming Liang

October 1, 2024

1 Accelerated composite gradient framework

We are interested in solving

$$\min\{\phi(x) := f(x) + h(x)\}\$$

- *h* is closed and convex;
- f is closed and convex, dom $h \subseteq \text{dom } f$, and f is L-smooth over some set Ω satisfying $\Omega \supset \text{dom } h$;
- the optimal set X_* is nonempty.

Algorithm 1 Accelerated composite gradient (ACG) framework

Input: Initial point $x_0 \in \text{dom } h$, set $y_0 = x_0$, $A_0 = 0$

for $k \geq 0$ do

Step 1. Choose $L_k > 0$ and compute

$$a_k = \frac{1 + \sqrt{1 + 4L_k A_k}}{2L_k}, \quad A_{k+1} = A_k + a_k, \quad \tilde{x}_k = \frac{A_k y_k + a_k x_k}{A_{k+1}}$$
 (1)

Step 2. Compute x_{k+1} and y_{k+1} using one of the rules listed below.

end for

Definition 1. Define

$$y(\tilde{x}_k; L_k) := \operatorname{argmin} \left\{ \ell_f(x; \tilde{x}_k) + h(x) + \frac{L_k}{2} ||x - \tilde{x}_k||^2 : x \in \mathbb{R}^n \right\}$$
 (2)

and

$$C(y; \tilde{x}) := \frac{2[f(y) - \ell_f(y; \tilde{x})]}{\|y - \tilde{x}\|^2}.$$
(3)

We say the positive parameter L_k is a good local curvature of f at \tilde{x}_k , if

$$C(y(\tilde{x}_k; L_k); \tilde{x}_k) \le L_k. \tag{4}$$

We will now describe three possible rules for computing the iterates x_{k+1} and y_{k+1} in step 2 of the above framework.

(i) (FISTA rule) This rule sets $y_{k+1}^f = y(\tilde{x}_k; L_k)$ where $y(\tilde{x}_k; L_k)$ is defined in (2) and $L_k > 0$ is a good upper curvature of f at \tilde{x}_k , and computes x_{k+1} as

$$x_{k+1}^f = P_{\Omega} \left(\frac{A_{k+1}}{a_k} y_{k+1}^f - \frac{A_k}{a_k} y_k \right). \tag{5}$$

FISTA rule was first introduced by Nesterov when h is the indicator function of a nonempty closed convex set and was later extended to general composite closed convex functions by Beck and Teboulle.

(ii) (AT rule) This rule computes

$$x_{k+1}^{a} = \underset{u \in \mathbb{R}^{n}}{\operatorname{argmin}} \left\{ a_{k} \left[\ell_{f}(u; \tilde{x}_{k}) + h(u) \right] + \frac{1}{2} \|u - x_{k}\|^{2} \right\}$$
 (6)

and

$$y_{k+1}^a = \frac{A_k y_k + a_k x_{k+1}}{A_{k+1}}. (7)$$

This rule was introduced by Auslender and Teboulle.

(iii) (LLM rule) This rule sets $y_{k+1} = y_{k+1}^f$ as in the FISTA rule and $x_{k+1} = x_{k+1}^a$ as in the AT rule. LLM rule was introduced by Lu, Lan and Monteiro.

Lemma 1. For every $k \geq 0$, we define

$$\tilde{\gamma}_k(u) := \ell_f(u; \tilde{x}_k) + h(u), \tag{8}$$

$$\gamma_k(u) := \tilde{\gamma}_k(y_{k+1}^f) + L_k \langle \tilde{x}_k - y_{k+1}^f, u - y_{k+1}^f \rangle.$$
(9)

Then the following statements hold for every $k \geq 0$:

(a) γ_k minorizes $\tilde{\gamma}_k$, $\tilde{\gamma}_k(y_{k+1}^f) = \gamma_k(y_{k+1}^f)$,

$$\min_{u} \left\{ \tilde{\gamma}_{k}(u) + \frac{L_{k}}{2} \|u - \tilde{x}_{k}\|^{2} \right\} = \min_{u} \left\{ \gamma_{k}(u) + \frac{L_{k}}{2} \|u - \tilde{x}_{k}\|^{2} \right\},$$

and these minimization problems have y_{k+1}^f as unique optimal solution;

- (b) for every $u \in \text{dom } h$, $\tilde{\gamma}_k(u) \leq \phi(u)$;
- (c) $x_{k+1}^f = \operatorname{argmin} \left\{ a_k \gamma_k(u) + \|u x_k\|^2 / 2 : u \in \Omega \right\};$
- (d) $\{x_k^a\}$, $\{y_k^f\}$, and $\{y_k^a\}$ are contained in dom h, while $\{x_k^f\}$ and $\{\tilde{x}_k\}$ lie in Ω .

Lemma 2. The following statements about scalars a_k and A_K hold for every $k \geq 0$:

(a)
$$A_{k+1} = L_k a_k^2$$
;

(b)

$$A_k \ge \frac{1}{4} \left(\sum_{i=0}^{k-1} \frac{1}{\sqrt{L_i}} \right)^2.$$

Proof. (a) It is easy to see that a_k as in (13) is the solution of

$$L_k a_k^2 - a_k - A_k = 0.$$

Using the second relation in (13), we have

$$A_{k+1} = A_k + a_k = L_k a_k^2.$$

(b) It follows from the first two relations in (13) that

$$\sqrt{A_{i+1}} = \left(A_i + \frac{1 + \sqrt{1 + 4L_i A_i}}{2L_i}\right)^{1/2} \ge \left(A_i + \frac{1 + 2\sqrt{L_i A_i}}{2L_i}\right)^{1/2} \ge \sqrt{A_i} + \frac{1}{2\sqrt{L_i}}.$$

Hence, we have

$$\sqrt{A_k} \ge \sqrt{A_0} + \sum_{i=0}^{k-1} \frac{1}{2\sqrt{L_i}} = \sum_{i=0}^{k-1} \frac{1}{2\sqrt{L_i}},$$

where the equality is due to $A_0 = 0$.

Proposition 1. For every $k \ge 0$, assume that L_k is a good local curvature. Then, for every $k \ge 0$ and $u \in \text{dom } h$, the following inequality holds for every rule

$$A_{k+1}[\phi(y_{k+1}) - \phi(u)] + \frac{1}{2}||u - x_{k+1}||^2 \le A_k[\phi(y_k) - \phi(u)] + \frac{1}{2}||u - x_k||^2.$$
 (10)

Proof. We first show (10) holds for the **FISTA rule**. For the ease of notation, we omit the superscript "f" in the proof for the FISTA rule. Using Lemma 1(c), the fact that $a_k \gamma_k(u) + \frac{1}{2} ||u - x_k||^2$ is 1-strongly convex, and Theorem 5 of Lecture 3, we have for every $u \in \text{dom } h$,

$$A_{k}\gamma_{k}(y_{k}) + a_{k}\gamma_{k}(u) + \frac{1}{2}\|u - x_{k}\|^{2} - \frac{1}{2}\|u - x_{k+1}\|^{2} \ge A_{k}\gamma_{k}(y_{k}) + a_{k}\gamma_{k}(x_{k+1}) + \frac{1}{2}\|x_{k+1} - x_{k}\|^{2}$$

$$\ge A_{k+1}\gamma_{k}(\hat{y}_{k+1}) + \frac{1}{2}\frac{A_{k+1}^{2}}{a_{k}^{2}}\|\hat{y}_{k+1} - \tilde{x}_{k}\|^{2} = A_{k+1}\left[\gamma_{k}(\hat{y}_{k+1}) + \frac{L_{k}}{2}\|\hat{y}_{k+1} - \tilde{x}_{k}\|^{2}\right]$$

$$(11)$$

where $\hat{y}_{k+1} = (A_k y_k + a_k x_{k+1})/A_{k+1}$ and the second inequality is due to the convexity of γ_k , and the equality is due to Lemma 2(a). It follows from Lemma 1(a) and the assumption that L_k is a good local curvature that

$$\gamma_k(\hat{y}_{k+1}) + \frac{L_k}{2} \|\hat{y}_{k+1} - \tilde{x}_k\|^2 \ge \gamma_k(y_{k+1}) + \frac{L_k}{2} \|y_{k+1} - \tilde{x}_k\|^2$$

$$= \tilde{\gamma}_k(y_{k+1}) + \frac{L_k}{2} \|y_{k+1} - \tilde{x}_k\|^2$$

$$\ge \phi(y_{k+1}).$$

Plugging the above inequality into (11) and rearraging the terms, we have

$$A_{k+1}\phi(y_{k+1}) + \frac{1}{2}\|u - x_{k+1}\|^2 - \frac{1}{2}\|u - x_k\|^2 \le A_k \gamma_k(y_k) + a_k \gamma_k(u)$$

$$\le A_k \tilde{\gamma}_k(y_k) + a_k \tilde{\gamma}_k(u)$$

$$\le A_k \phi(y_k) + a_k \phi(u),$$

where the last two inequalities are due to the fact that $\gamma_k \leq \tilde{\gamma}_k \leq \phi$ (see Lemma 1(a) and (b)). Finally, we conclude that

$$A_{k+1}[\phi(y_{k+1}) - \phi(u)] + \frac{1}{2}||u - x_{k+1}||^2 \le A_k[\phi(y_k) - \phi(u)] + \frac{1}{2}||u - x_k||^2.$$

We next show (10) holds for the **AT rule**. For the ease of notation, we omit the superscript "a" in the proof for the AT rule. Using (6), the fact that $a_k \tilde{\gamma}_k(u) + \frac{1}{2} ||u - x_k||^2$ is 1-strongly convex, and Theorem 5 of Lecture 3, we have for every $u \in \text{dom } h$,

$$A_{k}\tilde{\gamma}_{k}(y_{k}) + a_{k}\tilde{\gamma}_{k}(u) + \frac{1}{2}\|u - x_{k}\|^{2} - \frac{1}{2}\|u - x_{k+1}\|^{2} \ge A_{k}\tilde{\gamma}_{k}(y_{k}) + a_{k}\tilde{\gamma}_{k}(x_{k+1}) + \frac{1}{2}\|x_{k+1} - x_{k}\|^{2}$$

$$\ge A_{k+1}\tilde{\gamma}_{k}(y_{k+1}) + \frac{1}{2}\frac{A_{k+1}^{2}}{a_{k}^{2}}\|y_{k+1} - \tilde{x}_{k}\|^{2} = A_{k+1}\left[\tilde{\gamma}_{k}(y_{k+1}) + \frac{L_{k}}{2}\|y_{k+1} - \tilde{x}_{k}\|^{2}\right]$$

$$\ge A_{k+1}\phi(y_{k+1})$$

where the second inequality is due to the convexity of γ_k and the definition of y_{k+1} in (7), the equality is due to Lemma 2(a), and the last inequality follows from the assumption that L_k is a good local curvature. The rest of the proof is the same as that for the FISTA rule.

We finally show (10) holds for the **LLM rule**. Using (6), the fact that $a_k \tilde{\gamma}_k(u) + \frac{1}{2} ||u - x_k||^2$ is 1-strongly convex, and Theorem 5 of Lecture 3, we have for every $u \in \text{dom } h$,

$$A_{k}\tilde{\gamma}_{k}(y_{k}) + a_{k}\tilde{\gamma}_{k}(u) + \frac{1}{2}\|u - x_{k}\|^{2} - \frac{1}{2}\|u - x_{k+1}\|^{2} \ge A_{k}\tilde{\gamma}_{k}(y_{k}) + a_{k}\tilde{\gamma}_{k}(x_{k+1}) + \frac{1}{2}\|x_{k+1} - x_{k}\|^{2}$$

$$\ge A_{k+1}\tilde{\gamma}_{k}(\hat{y}_{k+1}) + \frac{1}{2}\frac{A_{k+1}^{2}}{a_{k}^{2}}\|\hat{y}_{k+1} - \tilde{x}_{k}\|^{2} = A_{k+1}\left[\tilde{\gamma}_{k}(\hat{y}_{k+1}) + \frac{L_{k}}{2}\|\hat{y}_{k+1} - \tilde{x}_{k}\|^{2}\right]$$

$$\ge A_{k+1}\left[\tilde{\gamma}_{k}(y_{k+1}) + \frac{L_{k}}{2}\|y_{k+1} - \tilde{x}_{k}\|^{2}\right] \ge A_{k+1}\phi(y_{k+1})$$

where $\hat{y}_{k+1} = (A_k y_k + a_k x_{k+1})/A_{k+1}$ and the second inequality is due to the convexity of γ_k , the equality is due to Lemma 2(a), the third inequality is due to Lemma 1(a), and the last inequality follows from the assumption that L_k is a good local curvature. The rest of the proof is the same as that for the FISTA rule.

In Step 1 of the ACG framework, we want to choose $L_k > 0$ to be a good local curvature satisfying (4). There two standard ways to do so.

1. Constant. Suppose we know the smoothness parameter (i.e., global curvature) L, then we can choose $L_k = L$ for every $k \ge 0$. It follows from Lemma 2(b) that

$$A_k \ge \frac{1}{4} \left(\sum_{i=0}^{k-1} \frac{1}{\sqrt{L_i}} \right)^2 = \frac{k^2}{4L}.$$

2. Adaptive. For every $k \geq 0$, we begin from some small $L_k^0 > 0$, check whether (4) is true with L_k replaced by L_k^0 , i.e.,

$$C(y(\tilde{x}_k; L_k^0); \tilde{x}_k) \le L_k^0.$$

If it is true, then we set $L_k = L_k^0$. Otherwise, we set $L_k^1 = 2L_k^0$, and check whether (4) is true with L_k replaced by L_k^1 and follow the previous step. The search for L_k stays in the loop until (4) is satisfied with some L_k^i , and we output $L_k = L_k^i$. It is easy to show that the interations of this search is bounded by $\log(L_k/L_k^0)$ and $L_k \leq 2L$. Moreover, it follows from Lemma 2(b) that

$$A_k \ge \frac{1}{4} \left(\sum_{i=0}^{k-1} \frac{1}{\sqrt{L_i}} \right)^2 \ge \frac{k^2}{8L}.$$
 (12)

Theorem 1. For every $k \geq 0$, we choose $L_k > 0$ to be a good local curvature satisfying (4), then we have

$$\phi(y_k) - \phi_* \le \frac{4L||x_0 - x_*||^2}{k^2}.$$

Proof. Using Proposition 1 and the fact that $A_0 = 0$, we have

$$A_k[\phi(y_k) - \phi_*] + \frac{1}{2}||x_k - x_*||^2 \le \frac{1}{2}||x_0 - x_*||^2.$$

This inequality and (12) imply that

$$\phi(y_k) - \phi_* \le \frac{1}{2A_k} ||x_0 - x_*||^2 \le \frac{4L||x_0 - x_*||^2}{k^2}.$$
